zirconia restorations

Zirconia restorations have been developed by the leading dental companies with design, reliability and biocompatibility in mind.

Zirconia has been around in other industries for many years. The material's strength is unsurpassed in the mouth combined with the beauty of modern ceramics, specifically developed for Zirconia. Restorations are digitally created using the most cutting edge dental techniques to give a crown or bridge that cannot be surpassed in natural beauty and fit.

// The Terec Group believes it is the best all-round ceramic solution today.

biocompatibility

It has been shown in recent studies that the 'Nature' of Zirconia makes it the most biocompatibly accepted material to live within the biological space. A material clinicians can place next to the tissue, whether it is a crown, bridge or an implant retained prosthesis without any gum reaction or irritation.
